## Introduction

African countries in general have a large amount of data on their education systems at their disposal. Statistical departments have been set up in almost all ministries of education, and school censuses are carried out practically everywhere. Even if the quality of these data is far from perfect, their importance for decision-making is obvious. Nevertheless, one can notice, in most countries, that decision-makers scarcely integrate these data into the process of defining educational policies. One part of the problem is that the choice of data available in statistical documents often lacks relevance: it does not allow for proper monitoring and control of the functioning of the system, nor does it adequately respond to the needs of decisionmakers. Data processing and making data available is most of the time a long and tedious process, resulting in the production of information which is often obsolete. If countries manage to more or less overcome the above difficulties a final problem crops up: the statistical reports are too cumbersome, containing too many data and information. Decision-makers need a document which is easier to read and to interpret, hence more analytical and more relevant.

Documents of this kind have recently been prepared in certain countries both developed and developing, and, with the support of the International Institute for Educational Planning, in Lesotho and Mali. In general these different documents outline the state of the education system, as well as its evolution, in approximately thirty indicators. Each indicator is presented in the form of tables and figures, and is accompanied by a brief analysis. The indicators are chosen in function of the country's educational policy. Therefore, they provide decision-makers with an essential instrument for evaluating and guiding their actions with respect to education.

Computer tools facilitate significantly the preparation of this type of document. Computers
are spreading rapidly in planning departments, at central level and sometimes at regional. But educational planners have expressed a serious need for training which would result in a more effective use of computers to the advantage of their work. It is therefore necessary to meet this growing demand to ensure efficient production of information, and in so doing bridge the gap between the production and utilization of information at different levels of administration.

In an attempt to address this problem the IIEP has prepared a methodological guide on the development and dissemination of indicators. This document is based, inter alia, on the experiences of Lesotho and Mali. In addition, the IIEP is launching a series of intensive sub-regional training courses with the aim of disseminating the concepts, methods and techniques necessary for the development of an indicators system.

The first course of this type, organized jointly with the UNESCO Office for the Sahel, and in co-operation with UNICEF, took place in Ouagadougou in September 1995, in which nine French-speaking West-African countries participated (Benin, Burkina Faso, Côte d'Ivoire, Guinea, Mali, Mauritania, Niger, Senegal and Togo). The second one was held in Nairobi, in cooperation with the Kenyan Ministry for Education, in July 1996, and gathered together countries from the sub-region of Eastern and Southern Africa (Botswana, Ethiopia, Kenya, Lesotho, Malawi, Mozambique, Somalia, South Africa, Tanzania, Uganda, Zambia, Zimbabwe).

The overall objective of the courses was to strengthen national capacities and, in particular, to provide planners and managers with the skills necessary to improve the use of data bases and to develop indicators on the functioning of the education system. More specifically, the objectives
were to improve the knowledge and the technical skills of the participants regarding the:

- strengths and weaknesses of some components of the information systems in their respective countries;
- identification of information needs and the appropriate use of the necessary data banks;
- development and analysis of indicators (the development of an indicators system);
- preparation of a document, on relevant indicators for monitoring the functioning of the education system, within a limited period of time;
- utilization of computerized text-processing software and spreadsheets to facilitate information processing and transmission.

The following areas were covered during the courses:

## Part I

The role of indicators in educational planning

## Part II:

The use of computer tools in preparing indicators

## Part III:

Analysis and communication of information
The first part examined the extent to which weaknesses in information systems can call into question the validity of certain indicators. The process of establishing indicators was then analysed and discussed, on the basis of national reports, prepared by the participants, and of studies carried out by IIEP on indicator systems. Each national team was asked to outline the objectives of their national education policy and to identify indicators pertaining to those objectives. More precisely, the topics covered by this first part were:

- the role of indicators on the functioning of the education system in educational management;
- identification of information needs, and their availability;
- selection of indicators;
- calculation and consistency of results.

The second part demonstrated the advantages of using computers to prepare and present indicators,
in particular the use of spreadsheets, textprocessing software, and where necessary a geographic information system. The following themes were covered:

- data entering and calculating indicators using a spreadsheet;
- introduction to a geographic information system for analysing regional disparities;
- preparation of the national documents-making tables and figures;
- updating the documents.

Once the above tasks have been accomplished, the analysis of the results is the remaining challenge: it has to be done in an explicit, short but comprehensive, and useful way for decisionmakers. The participants were invited to prepare such an analysis of the various indicators to be presented in the document. More specifically, the following issues were examined:

- process of analysing indicators;
- presentation of the results in the document.

The organization of the courses involved various pedagogical methods; the most common ones being practical exercises, group discussions, and handson practice on computers.

The course in Nairobi, as in Ouagadougou, achieved two major results. Firstly, the participants were made aware of the use of an indicators report, and of its feasibility, even within the context of budgetary constraints. They also acquired the skills necessary to complete such a document in a relatively short period of time. Secondly, every national team identified and analysed a few essential indicators on its education system, in order to demonstrate what could be done with existing data. This analysis should appear in an attractive 'doublepage' format presenting both tables and figures, as well as written comments on each indicator. In the wake of these courses, several countries have moreover began to set up an education indicators system. Senegal, for instance, managed to publish, in 1995 and 1996, an indicators report on basic education. Mali has finalized a second report which will be published in the near future (the first one was prepared with the assistance of the IIEP in
1993). Different English-speaking countries of Eastern and Southern Africa foresee to publish the first issue of their national indicators report in 1997.

This publication presents the practical work carried out by the participants at the course held for the Eastern- and Southern-African region, except for South Africa which was not officially represented. A similar type of document has already been published on the work realised by the participants at the course for French-speaking Western Africa. The IIEP felt that it would be both interesting and useful to publish this work for three reasons. First and foremost, in presenting the results of a twoweek training course, this publication demonstrates that the completion of an indicators' report is a task that can be accomplished in a reasonable lapse of time. However, this does not imply that it is a simple exercise, but rather that technical difficulties should not be seen as an obstacle in this endeavour. An intensive training course of two weeks duration can, in fact, provide planners with the basic technical skills necessary for such an achievement.

Furthermore, the documents prepared by the national teams illustrate, as in a catalogue, the different possibilities for presenting the same indicator. The teams chose different types of figures to represent, for example, the evolution of the gross enrolment rate, or regional disparities or disparities between the sexes. The commentaries do not always follow the same outline and do not always place the emphasis on the same elements. Indeed, a specialist with a similar task would get a source of inspiration from this document by taking a close look at each teams' approach, even if sometimes the accounts are not perfect. The choice of figures is open to discussion in certain cases, and the text containing the analysis could, here and there, be improved upon. The Institute felt that it would be preferable, nevertheless, to publish the work as it is, the main aim being simply to present the results of an intensive course as an illustration of what can be done, within a specific time frame, with available data.

Finally, although this is not the primary objective, the document contains statistics on the situation of the education system in ten English-speaking

Eastern- and Southern-African countries. For the most part, this information is based on the most recent statistical data available from educational planning offices. They provide a fairly detailed picture of the development of education in an African region on which few recent data are available. The IIEP hopes that the publication will reinforce the idea that the setting up of an indicators system on the development of education is both useful and feasible, and that its dissemination will encourage the responsible government officials to support the implementation of such systems within their ministries.

## Gross and net enrolment ratios in Botswana

For the years 1986-1989 the gross enrolment ratio (GER) was constant at around 111 per cent. From 1990 it started declining gradually from 109.9 to 102.1 per cent in 1994. During 1986-1989 there were many over-age children enrolled in primary schools. The delay in enrolling children might have been due to the distance that children had to travel to schools. Moreover, some children did not go to school at all because they helped their parents at home. The decline in GER experienced in 1990-1994 can be explained by the important
increase in the number of private English-medium schools, which admit most of the under-age children: they have risen from 23 to 57 , an increase of 147.8 per cent.
The net enrolment ratio (NER) from 1986 to 1989 shows that 7 per cent of school-age children were not enrolled in formal schools. NER declined from 90.7 per cent in 1990 to 84.6 percent in 1994 due to the mushrooming of English-medium schools. This means that children completed primary education earlier than expected.

Table 1. Evolution of enrolment

| Year | GER | NER |
| :---: | :---: | :---: |
| 1986 | 110.3 | 93.3 |
| 1987 | 111.0 | 93.5 |
| 1988 | 111.3 | 93.2 |
| 1989 | 111.9 | 92.6 |
| 1990 | 109.9 | 90.7 |
| 1991 | 109.7 | 92.7 |
| 1992 | 108.3 | 90.3 |
| 1993 | 105.0 | 87.6 |
| 1994 | 102.1 | 84.6 |

Figure 1. Evolution of enrolment

## Intake rates in Botswana

Although the official entry age stands at seven years, almost all districts admit children who are under-age (Table 2). The national percentage of
under-age children is 19.6 which might explain the decline in NER (Table 1) from 1990 to 1994.

Table 2. Admission by age and region, 1994

|  |  |  |  |

| Total | 19.6 | 47.5 | 41.2 |

Figure 2. Distribution of admission by age and region, 1994

## Pupil/teacher ratio by district

The pupil/teacher ratio in urban areas is high compared with that of rural areas (Table 3). The pupil/teacher ratio ranges from 19:1 in Kgalagadi (remote) to $37: 1$ in South Phikwe (urban area).

Most of the semi-urban areas have a pupil/teacher ratio ranging from $23: 1$ to $28: 1$ comparing well with the national average of $27: 1$.

Figure 3. Pupil/teacher ratio

## Trained teachers and percentage of passes by district in Botswana

Most of the districts are well staffed with trained teachers, the least being Kgalagadi with 80 per cent (Table 4). Although the percentage of trained teachers does not appear to differ greatly, the performance of some districts is very low, e.g. 57.7 per cent passes in Gantsi despite 93.2 per cent of trained teachers. This shows that the quality of
education cannot be evaluated by one indicator. Some of the other indicators that may be considered are pupil/teacher ratio, pupils/book ratio, physical facilities, pupils attendance, etc. The percentage of passes in urban areas is higher than that in rural areas. The reason may be that the environment in urban areas is more conducive to learning.

Table 4. Percentage of trained teachers and passes by district, 1994

| Districts | \% Trained | \% Passes |
| :--- | :---: | :---: |
| C. Central | 94.6 | 66.8 |

## Gross enrolment ratio ${ }^{1}$

Throughout the 10 years under consideration, the gross enrolment ratio at primary level for boys has been greater than for girls. The gross enrolment ratio exhibited an increasing trend between 1985 and 1988, but experienced a continuous decline in the five years (1988/89-1992/93) that followed. However, it has started to grow again since 1993/
94. This recent increase in the gross enrolment ratio, however is accompanied by a simultaneous increase in the gap between boys and girls. As can be seen clearly from Figure 1, the recent rise in the gross enrolment ratio has not been sufficient to make up for the preceding loss in enrolment. The level reached in 1987/88 has not yet been attained.

Table 1. Gross enrolment ratio at primary (1-6) level

| Year | Boys | Girls | Total |
| :---: | :---: | :---: | :---: |
| $1985 / 86$ | 44.5 | 30.0 | 37.4 |
| $1986 / 87$ | 48.9 | 32.4 | 40.8 |
| $1987 / 88$ | 50.5 | 32.8 | 41.9 |
| $1988 / 89$ | 47.9 | 32.3 | 40.3 |
| $1989 / 90$ | 43.0 | 29.5 | 36.5 |
| $1990 / 91$ | 38.5 | 26.7 | 32.7 |
| $1991 / 92$ | 30.2 | 22.7 | 26.5 |
| $1992 / 93$ | 26.9 | 19.2 | 23.1 |
| $1993 / 94$ | 33.4 | 21.4 | 27.5 |
| $1994 / 95$ | 39.0 | 23.4 | 31.3 |

Figure 1. Gross enrolment ratio at primary (1-6) level, 1985-1994

[^0]
## PupiVteacher ratio

The norm for the pupil/teacher ratio set by the Ministry of Education is $50: 1$. But the average national pupil/teacher ratio ranged over the past 10 years from 27:1 in 1992/93 to 49:1 in 1987/88. The pupil/teacher ratio has thus been below the national standard in all the years under consideration. The fact that the lowest pupil/ teacher ratio was recorded in 1992/93 could be explained by a comparison with the evolution of
the gross enrolment ratio, which was at a low in the same year.
A look into the pupil/teacher ratio on a regional basis shows that the national norm is exceeded in only one region: Addis Ababa (51:1). Two other regions have a ratio close to the national standard. The Somale region has the lowest pupil/teacher ratio (21:1). For most of the other regions the ratio lies between 23:1 and 38:1.

Table 2. Pupi/teacher ratio

| Year | Ratio |
| :---: | :---: |
| $1985 / 86$ | 48 |
| $1986 / 87$ | 48 |
| $1987 / 88$ | 49 |
| $1988 / 89$ | 43 |
| $1989 / 90$ | 41 |

Figure 3. Pupil/teacher ratio by region, 1994/95

## Proportion of teachers by gender, qualification and region

At the national level, the proportion of male and female teachers is 72.6 per cent and 27.4 per cent respectively, while the proportion of qualified and non-qualified teachers stands at 85.8 per cent and 14.2 per cent respectively. This implies that there is not only a need to employ more females in the teaching profession, but also to upgrade the level of the 14.2 per cent of underqualified teachers.
The non-qualified teachers are to be found mainly in four regions (in decreasing order, the Southern

Table 4. Proportion of teachers by gender and qualification

| Gender | Qualification |  |  |
| :--- | ---: | ---: | ---: |
|  | Qualified | Non-qualified | Total |
| Male | 62.4 | 10.2 | 72.6 |
| Female | 23.4 | 4.0 | 27.4 |
| Total | 85.8 | 14.2 | 100 |

Table 5. Distribution of underqualified teachers by region, 1994/95

| Region | Proportion |
| :--- | :---: |
| Tigray | 4.7 |
| Afar | 0.7 |
| Amhara | 8.8 |
| Oromia | 28.7 |
| Somale | 0.02 |
| Benishangul-Gumuz | 1.6 |
| SNNP | 38.2 |
| Gambella | 0.1 |
| Harari | 0.3 |
| Addis Ababa | 15.9 |
| Dire-Dawa | 1.1 |
| Total |  |

Nations, Nationalities and Peoples (SNNP) region, Oromia, Addis Ababa and Amhara). Together they account for more than 90 per cent of all nonqualified teachers. Regions such as Afar, Somale, Gambella and Harari together account for just over 1 per cent of all non-qualified teachers.
Hence, in providing in-service training for the 14.2 per cent of underqualified teachers, due emphasis should be given to those regions with a higher proportion of under-qualified teachers.

Figure 4. Proportion of teachers by gender, 1994/95

Figure 5. Proportion of teachers by qualification, 1994/95

## Proportion of teachers by gender

Over the past 10 years, notwithstanding some changes, the proportion of female teachers has never exceeded 27.4 per cent. Between 1985/86 and $1988 / 89$, the share of female teachers in the total teaching force actually declined, slowly but continuously, from 25.6 to 23.0 per cent. However,
it has slowly but continuously started to increase since 1989/90. However, as the present rate of increase in the proportion of female teachers is nearly not sufficient to bring about gender balance in the near future, it is important to take necessary measures which will help to close this gap.

Table 6. Proportion of primary teachers by gender, 1985/86-1994/95

| Year | Male | Female |
| :--- | ---: | ---: |
| $1985 / 86$ | 74.4 | 25.6 |
| $1986 / 87$ | 75.7 | 24.3 |
| $1987 / 88$ | 76.0 | 24.0 |
| $1988 / 89$ | 77.0 | 23.0 |
| $1989 / 90$ | 76.3 | 23.7 |
| $1990 / 91$ | 76.1 | 23.9 |
| $1991 / 92$ | 75.0 | 25.0 |
| $1992 / 93$ | 74.4 | 25.6 |
| $1993 / 94$ | 73.4 | 26.6 |
| $1994 / 95$ | 72.6 | 27.4 |

# A FEW INDICATORS ON PRIMARY EDUCATION 

## KENYA

Document prepared by :

Mr Titus Mbiti KATEMBU, Ms Agnes W. KOORI, Mr Samuel Nduati KARANJA, Mr Indeje WANYAMA Planning and Development Department

Ministry of Education

## Gross Enrolment Rates

The Gross Enrolment Rates (GER) in primary school in Kenya have been declining continuously (Table 1 and Figure 1), dropping from 94.7 per cent in 1989 to 79.1 per cent in 1995.
Table I shows that the gender gap in GER has been closing, which conforms to Government policy (to make available equal opportunities to all children regardless of sex). In this regard there have been Girl child education programmes to sensitize the community to the education of girls.
GER in all provinces show a general decline over the 1989-1995 period (Table 2 and Figure 1). The most worrying decline was recorded in North-

Eastern province, which had a GER of 30 per cent in 1989 falling to 19.7 per cent in 1995. The possible explanations for this scenario could be the following factors: that the province is inhabited by nomadic people, the difficult terrain and socio-economic conditions.
In Central and Western Provinces the decline in GER was marginal, possibly because these areas have high potential. However, it should be noted that the implementation of structural adjustment programmes has had an impact on the poor and vulnerable groups which could be associated with the declining GER.

Table 1. Primary schools gross enrolment rates by sex, 1989-1995

Figure 1. Gross enrolment rates by province, 1989-1995

## Pupil/teacher ratios

The pupils/trained teacher ratio and the pupil/ teacher ratio have been improving over the period under review (see Table 3 and Figure 2). Whereas it is the official policy to have a pupil/teacher ratio of $40: 1$, in 1988 the pupil/teacher ratio was $33: 1$ compared to $30: 1$ in 1995. It is worth noting that the pupil/trained teacher ratio also improved from 47:1 in 1988 to $34: 1$ in 1995. The improvement of the ratio, though deviating from the set norm, offers adequate time for individual pupil-teacher interaction which is central to improving the quality of education, especially in a practically oriented curriculum.
The improving trends in the pupils/trained teacher ratio could be attributed to the government policy of non-recruitment of untrained teachers and the phasing-out training programme through in-service and pre-service teacher training. The expansion and
building of new colleges under government/IDA funding has led to an increase in the number of trained teachers in the country. This explains why the gap between the two ratios is closing as illustrated in Figure 2.
Generally, the pupils/trained teacher ratio was not very different across the provinces in 1995 (Table 4). It was lowest in North Eastern (31:1) and highest in Western (36:1). The national average stood at $34: 1$ which was below the set target of 40 . This implies that factors other than the supply of trained teachers led to the decline in GER.
If the country had achieved universal primary education in 1995 (Table 4), the ratio would surpass the target of $40: 1$ to $43: 1$ as indicated in the table. Coast, Nairobi, Rift Valley, and particularly NorthEastern provinces would have a shortage of trained teachers.

Table 3. Pupil/teacher ratios in primary schools, 1988-1995

| Year | Pupils/trained <br> teacher ratio | Pupil/teacher <br> ratio* |
| :---: | :---: | :---: |

## Drop-out and repetition rates

The analysis of the drop-out rates by province in 1993 shows that in Nairobi boys were dropping out more than girls, whereas the contrary was true for North Eastern (Table 6). In the other provinces gender parity had almost been achieved. The national repetition rate stood at 15.4 per cent in 1993, where the boys and girls rates were 15.6 per
cent and 15.2 per cent respectively. Most of the provinces recorded nearly the same rates for both sexes except North Eastern, where gender disparity was much higher. Nairobi province, and to a lesser extent North Eastern, exhibited very low rates, compared to the other provinces.

Table 5. Drop-out rates in primary schools by province, 1993

| Province | Boys | Girls | Total |
| :--- | :---: | :---: | :---: |
| Coast | 4.2 | 3.9 | 4.1 |
| Central | 2.2 | 2.2 | 2.2 |
| Eastern | 5.8 | 5.4 | 5.6 |
| Nairobi | 6.7 | 3.3 | 5.1 |
| Rift Valley | 5.7 | 5.8 | 5.8 |
| Western | 8.0 | 8.0 | 8.0 |
| Nyanza | 6.5 | 6.6 | 6.5 |
| North Eastern | 8.7 | 11.2 | 9.4 |
| National | $\mathbf{5 . 5}$ | $\mathbf{5 . 3}$ | $\mathbf{5 . 4}$ |

These are sample data from about 8,000 primary schools.

Figure 5. Drop-out rates in primary schools by province, 1993

## Primary school completion rates

The completion rates in the country have been relatively stable over the years (Table 7 and Figure 6 below). However, the rate for girls has been increasing marginally, while that of boys has been declining. In 1995, the completion rate
for girls had surpassed that of boys. The higher completion rates for girls may be attributed to gender sensitization programmes which have reduced the drop-out and repetition rates, a scenario depicted in Tables 5 and 6.

Table 7. Primary school completion rates by sex, 1988-1995

| Year | Boys | Girls | Total |
| :---: | :---: | :---: | :---: |
| 1988 | 47.4 | 39.6 | 43.6 |

## Net enrolment ratios (NER) in Lesotho

For policy-makers and all concerned with the development of education in Lesotho, NER is a measure by which they can see how far they are from achieving the objective of universal primary education by the year 2000 and to gauge the magnitude of the problem of children of primaryschool age who are not in the school system.
According to Table 1, NER, while staying fairly stable between 1985 and 1992, saw a sudden, rather
steep, drop in 1993. This could be attributed to the general decline in enrolment as a result of many pupils recently leaving Lesotho to enrol in schools in South Africa. NER hovered at around 67 per cent and 86 per cent in 1985 for males and females respectively to the 1994 levels of 63.8 per cent and 76.1 per cent for males and females respectively; the gap has been decreasing slowly.

Table 1. Net enrolment ratios in primary schools, 1985-1994

| Year | Total | Males | Females |
| :---: | :---: | :---: | :---: |
| 1985 | 76.4 | 66.8 | 85.8 |
| 1986 | 75.8 | 66.7 | 84.8 |
| 1987 | 77.3 | 68.1 | 86.4 |
| 1988 | 78.3 | 69.4 | 87.1 |
| 1989 | 77.3 | 68.8 | 85.7 |
| 1990 | 75.8 | 67.8 | 83.7 |
| 1991 | 76.8 | 68.9 | 84.6 |
| 1992 | 76.3 | 68.0 | 84.6 |
| 1993 | 70.7 | 63.8 | 77.7 |
| 1994 | 69.9 | 63.8 | 76.1 |

Figure 1. Evolution of NER

## Pupil/teacher ratios in Lesotho

The official pupil/teacher ratios for primary schools in Lesotho is $40: 1$ but the actual pupil/ teacher ratios have been significally higher than the official ratio during the 10 year period ending in 1994 (Table 2 and Figure 2). The pupil/teacher ratio in 1993 and 1994 were lower compared to the previous years. This could be due to the general decline of enrolment in 1993 and 1994 relative to the stock of the teaching force in the same period. The variations of this ratio by district are shown in

Figure 3.The districts of Leribe and Quthing had the highest pupil/teacher ratios, of over 52:1 in 1994. Mokhotlong as a district, had the lowest ratio and was the only region below the norm of 40:1. Improving this ratio for all other districts will help to achieve the following policy objectives of :

- upgrading the quality of primary education ;
- supplying and retaining teachers in primary schools; and
- reducing overcrowding in primary schools.

Table 2. PupiVteacher ratios in primary schools, 1985-1994

| Year | Number of <br> pupils | Number of <br> teachers | Pupil/teacher <br> ratios |
| :---: | :---: | :---: | :---: |
| 1985 | 314,003 | 5,663 | 55.4 |

| Total | 366,506 | 7,428 | 49.3 |

Figure 3. Pupil/teacher ratios by district

## Repetition rate in Lesotho

The repetition rates have been improving lately, although they are still high for males (Table 4). However, for males, they have decreased from levels of about 23 per cent in 1985 and 1986 to levels of 19.9 in 1992 and 1993. Repetition rates in 1990 are considerably higher, as shown in Figure 4. This could be due to the most massive teacher strike, in 1990, ever seen in the country.
In 1994, Butha-Buthe, Leribe, Mokhotlong and Thaba-Tseka reported higher repetition rates compared to other districts (Table 5). Qacha's Nek, a mountain district, surprisingly reported the lowest rate of 14.3. As for the other mountain and remote districts of Mokhotlong and Thaba-Tseka, it was
not that surprising that they reported high repetition rates of 18.4 and 18.0. Schools in these districts are characterized by poor facilities, inaccessibility due to scattered settlements and high pupils/ classroom ratios. Thus, the mountain and remote districts do not have the best educational inputs to make learning effective.
In all the districts nationwide, repetition rates for females are lower than for males (Figure 5). For socio-economic reasons, a male child in Lesotho has been more disadvantaged than his female counterpart as far as schooling is concerned. But lately, new avenues are opening up for equal opportunities in education for both boys and girls.

Table 4. Repetition rate in primary schools, 1984-1993

| Year | Male | Female |
| :---: | :---: | :---: |
| 1987 | 21.1 | 19.6 |
| 1985 | 23.0 | 20.3 |

Figure 5. Repetition rates by district

## Percentage of pupils reaching Standard 4 <br> Percentage of pupils reaching Standard 7 <br> Percentage of pupils passing PSLE (Primary School Leaving Examination)

There were no vast differences observed in how the pupils would normally move and be retained in the system-move from Standard 1 to Standard 4 and consequently reach Standard 7 in almost all the regions (districts) of the country, except for the mountain and remote districts of Mokhotlong and Thaba-Tseka, which had relatively lower percentages of pupils reaching Standard 4 and Standard 7. The two districts had percentages in the 50s for males and 70s for females, while other districts had higher percentages reaching Standard 4 (Table 6). The flow rates show that, finally, only one out of three boys would reach Standard 7 in
these districts.
In the percentages of pupils reaching Standard 4 then proceeding to Standard 7, differences between the male and female pupils are marked. In all regions of the country, girls are doing better than boys. Maseru and Berea, in particular, would appear to have succeeded in retaining more pupils, especially girls, in the system to reach the last grade of the primary cycle - Standard 7. Sustainable literacy would be assured if the education system were better geared towards retaining pupils to Standard 7.

# A FEW INDICATORS ON PRIMARY EDUCATION 

## MALAWI

Document prepared by :

Mr McWanders H.D. CHATSIKA and Mr Michael K. MAKINA<br>Planning Division

Ministry of Education

## Gross enrolment rate

The gross enrolment rate (GER) increased steadily between 1985/86 and 1993/94. The yearly increase ranged from about one to three percentage points. Between the 1993/94 and the 1994/95 school years, GER suddenly shot up from 72.1 to 105.9 per cent. This remarkable increase is probably unique to Malawi. It came about due to the abolition of
direct and indirect school fees in primary schools. It can be argued that, through this important change, universal primary education has almost been achieved in Malawi. Disparity between the sexes, while it decreased significantly up to 1993/94, has widened again and remains worrying.

Table 1. Evolution of the gross enrolment rate

|  | Gross enrolment ratio |  |  |
| :---: | :---: | :---: | :---: |
|  | Male | Female | Total |
| $1985 / 86$ | 58.6 | 44.7 | 51.6 |
| $1986 / 87$ | 59.3 | 46.5 | 52.9 |
| $1987 / 88$ | 57.7 | 46.4 | 52.0 |
| $1988 / 89$ | 61.2 | 49.8 | 55.5 |
| $1989 / 90$ | 63.9 | 52.1 | 58.0 |
| $1990 / 91$ | 64.5 | 53.4 | 59.0 |
| $1991 / 92$ | 72.5 | 62.2 | 67.4 |
| $1992 / 93$ | 73.6 | 67.1 | 70.4 |
| $1993 / 94$ | 74.1 | 70.1 | 72.1 |
| $1994 / 95$ | 111.1 | 100.6 | 105.9 |

Figure 1. Evolution of the gross enrolment rate

## Enrolment by sex and standard

Over the past three years, enrolment in Standard 1 has been high and increasing. It is notable also that disparities between sexes are negligible at this grade: there were actually more girls than boys in grade 1 in the two previous years. But as soon as it comes to standard 2, there is a sharp decrease in enrolment for both sexes, though more marked for girls. The reason for this early and worrying dropout is related to the fact that it is relatively easy for most parents to enrol a child in school, but much more difficult to keep him/her there: many parents
need to assign the children to duties at home, especially girls, who usually assist their mother in various domestic duties. At every stage, there is a continued drop in enrolments due to many disincentives such as long distances from school, poor school environment, inadequate teaching and learning facilities and poor health, just to mention a few. One can also note that enrolment in 1994/95 was much higher, in all grades, than in the preceding year, a result of the abolition of fees.

Table 2. Enrolment by sex and standard

|  | $1992 / 93$ |  | 1993/94 |  |  | 1994/95 |  |
| :---: | ---: | ---: | ---: | ---: | ---: | ---: | :---: |
| Standard | Male | Female | Male | Female | Male | Female |  |

Figure 2c. Enrolment by sex and standard, 1994/95

## Admission rates and new entrants

The gross admission rate (GAR) and the net admission rate (NAR) have evidenced an exponential increase over the past year, because of the abolition of both direct and indirect school fees. The gap between the GAR and NAR, however, is very wide because of the large proportion of new entrants which are under- and over-age. A large proportion of the over-age pupils in Standard 1
are drop-ins. Table 4 and Figure 3 show the distribution of all new entrants in Standard 1 by age ( 5 to $14+$ ). In both 1993/94 and 1994/95 the proportion of six-year olds (the official entry age) was the highest. But the share of over-age pupils is impressive: indeed, about 70 per cent of all new entrants are seven years or older, with a sizeable group being over ten years of age.

Table 3. Gross and net admission rates

|  | GAR | NAR |
| :---: | :---: | :---: |
| $1993 / 1994$ | 155.2 | 42.2 |
| $1994 / 1995$ | 244.9 | 68.0 |

## Pupil/teacher ratio

For Malawi as a whole, the pupil/teacher ratio stood at $68: 1$, both in 1992/93 and 1993/94, and went down to $62: 1$ in 1994/95. This decrease was accompanied by a large increase in pupil enrolment. The Government, which had expected the enrolment increase in 1994/95, with the introduction of free primary education, recruited 15,000 paraprofessional teachers and re-employed 4,000 retired qualified teachers. It is the Ministry's policy to reach a pupil/teacher ratio of $60: 1$ by the
year 2005. There exist differences between the three regions: the pupil/teacher ratio for the north is significantly lower, as compared to both the central and the southern regions. This is mainly because many people in the northern region emigrate in search of employment in either the centre or south, where there are more job opportunities, both in the government and private sectors.

Table 5. Pupil/teacher ratio by region

## 1st level of primary

## Enrolment

Between 1990 and 1992 enrolment decreased by 4,8 per cent due to the war.
However, following the signature of the Peace Agreement in 1992, enrolments witnessed an increase of 8.5 per cent in the 1992-94 period. This increase was the result of the building and renovation of schools destroyed during the war. The proportion of girls participating at this level has in general remained constant, 43.1 per cent in 1990 to 42 per cent in 1994: but in urban zones the proportion of girls equals that of boys.

These indicators illustrate that more boys are attending school than girls in rural areas.
The gross enrolment rate decreased from 62.9 per cent in 1990 to 54.2 per cent in 1994, while the net enrolment rate witnessed, during the same period, a decrease of 11.9 percentage points (from 43.5 per cent to 31.6 per cent).
The net enrolment rate shows that many pupils are over-aged at first level of primary. This can be explained, inter alia, by late entrance into the education system, and repetitions.

Table 1. Evolution of enrolment in the first level of primary, 1990-1994

| Sex | 1990 | 1991 | 1992 | 1993 | 1994 |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Total | $1,260,218$ | $1,217,364$ | $1,199,476$ | $1,227,341$ | $1,301,833$ |
| Girls | 542,908 | 519,927 | 511,099 | 521,422 | 547,066 |
| Boys | 717,310 | 697,437 | 688,377 | 705,919 | 754,767 |
| $\%$ Girls | 43.1 | 42.7 | 42.6 | 42.5 | 42.0 |

Figure 1. Enrolment in the first level of primary

NB: This publication concerns primary education, which includes two levels, the first covers Grades I to 5, and the second, Grades 6 and 7 (5+2).
Overall primary education in 1994 comprised 3953 schools, 95.2 per cent at $l^{\circ}$ level and 4.8 per cent at 2 nd level. It is obvious that there exists a huge disparity between these two levels, with implications on the level of the supply.
Following primary education comes secondary-level education (Ensino Secundário Geral), which consists of two cycles: the first covering grades 8 to 10 , while the second covers grades 11 and $12(3+2)$.

Table 2. Gross and net enrolments rates, 1st primary level

| Rate | Sex | 1990 | 1991 | 1992 | 1993 | 1994 |

## A few indicators on internal efficiency

The promotion rate as shown in Figure 5 at Primary 1st level, decreased from 58.5 per cent in 1990 to 54.2 per cent in 1992. It later increased to 56.4 per cent in 1994, but remains at a rather low level. Among several other reasons, one can highlight the following:

- lack of teachers;
- high pupil/teacher ratio;
- scarcity of textbooks as well as teacher manuals;
- lack of incentives for teachers.

The drop-out rate rose from 10 per cent in 1990 to 16.3 per cent in 1992. However, since 1992 it has decreased and was recorded at 10.7 per cent in
1994. Female drop-out figures, during the same period, resemble those of boys and this phenomenon remains a serious problem, deserving attention in the education management system. The repetition rate increased from 31.4 per cent in 1990 to 32.9 per cent in 1994. Both repetitions and drop-outs have contributed to an increase of repeaters and therefore a reduction in admittance of new pupils to grade 1 .
Although the number of teachers is increasing each year, the pupil/teacher ratio remains high, 58:1 in 1994, with a clear negative impact on promotion rates.

Table 3. Indicators on internal efficiency 1st level, 1990-1994

| Rates | Sex | 1990 | 1991 | 1992 | 1993 | 1994 |
| :--- | :--- | ---: | ---: | ---: | ---: | ---: |
| Drop-out | Total | 10.0 | 12.3 | 16.3 | 12.0 | 10.7 |
|  | Girls | 9.9 | 12.0 | 15.2 | 11.9 | 10.2 |
| Repetition | Boys | 10.0 | 12.5 | 17.0 | 12.1 | 11.0 |
|  | Total | 31.4 | 30.7 | 29.5 | 31.9 | 32.9 |
|  | Girls | 33.7 | 33.0 | 31.9 | 34.2 | 35.5 |
|  | Boys | 29.7 | 29.0 | 27.8 | 30.2 | 31.1 |
|  | Total | 58.6 | 56.9 | 54.2 | 56.1 | 56.4 |
|  | Girls | 56.3 | 54.9 | 52.9 | 54.0 | 54.3 |

Figure 5. Drop-out rate, primary education, 1st level

Figure 6. Repetition rate, primary education, 1st level

## Pupils by grade

Since 1992, the number of pupils by grade has been increasing annually, although the trend concerning girls participation is in decline. While the proportion of girls in 1st grade is 44 per cent, it is about 40 per cent in 5 th grade. Figure 4 illustrates the
preponderance in 1st grade of the 8-15 year-old group compared to the 6 year-old group which corresponds to the official admission age. This situation, again, is a result of late entrance and repetition.

Table 4. Enrolment by sex and grade, primary 1 st level

| Grade | Sex | 1990 | 1991 | 1992 | 1993 | 1994 | 1995 |

Figure 7. Pupils of 1st grade, 1995

## Pupil/teacher, pupil/stream

The number of trained teachers has increased each year, from 71.9 per cent in 1990 to 75.7 per cent in 1994. However, it is important to point out that teacher qualifications vary and are of little relevance. The pupil/teacher ratio saw an increase
in the last year for which data were available (1994), while the pupil/stream ratio did not vary with the apparent trend. The difference between the two ratios may be explained by the fact that a teacher teaches several streams.

Table 5. Number of teachers and pupi/teacher, pupiI/stream ratio

|  | 1990 | 1991 | 1992 | 1993 | 1994 |

Figure 8. Pupil/teacher and pupil/stream, primary education, 1st level

## Graduates, and transition from 1st to 2nd level

Since the 1990 school year, the number of graduates of primary education at 1 st level has decreased. The proportion of female graduates, during the same time, is almost the same (Table 6 and Figure 9). The transition rate from 1 st level to

2nd level of primary education, between 1990 and 1993 , increased by 2.8 per cent. The increase during this period was higher for boys ( 4.2 per cent) than for girls ( 0.7 per cent).

Table 6. Graduates, 1st level of primary education

Figure 10. Transition rates from 1st to 2nd level of primary education

## 2nd Level of primary education, grades 6 and 7

This level admits the graduates of first level. The number of pupils in this second level of primary education decreased by 1.8 per cent between 1991 and 1994. In 1995, the second level witnessed an increase of 2.2 per cent.
The proportion of girls rose from 39 per cent in 1990 to 40.2 per cent in 1992, and then remained relatively stable until 1995. This proportion is, as at first level, higher in the south of Mozambique
(provinces of Maputo, Gaza, Inhambane and the city of Maputo). In 1994 the proportion of girls attending the second level of primary, in the southern region was 47.9 per cent while in the centre and north of the country, it was 33.9 per cent and 29.1 per cent respectively.
As can be observed from transition rates, in Table 7, the capacity of the second level of primary as it now stands is very limited.

Table 8. Pupils, 2nd level of primary education, grades 6 and 7

# A FEW INDICATORS ON PRIMARY EDUCATION 

## SOMALIA

Document prepared by :

Mr Osman Sheik Adan HAIDAR EDC, Informal Education Co-ordinator UNESCO-PEER, Somalia represented in Kenya

## Elementary school education in Somalia

It has been very difficult to obtain education statistics in Somalia for the past six years. But during 1994 UNESCO-Somalia tried to collect the lower primary enrolment in the regions. This was done during the presence of United Nations forces in Somalia. This information is based on estimations, therefore it does not represent the school-going population in Somalia, because this estimation covers only 11 of the 18 regions. Figure $l$ shows enrolment according to region in 1994. The three regions Banadir, Bay and Hiran have the highest number of enrolled children, with over half of all children enrolled in Banadir. This is because
a large number of United Nations forces were stationed in these areas, which therefore attracted a number of donor agencies and NGOs. An additional reason for the Banadir region having such high enrolment is that many displaced people were living there during 1994. Not unexpectedly, the number of pupils decreases from Grade 1 to Grade 4. In two regions, however, lower Shabelle and Bay, enrolment is highest in Grade 3 and Grade 2 respectively. In the case of lower Shabelle, the displaced people are returning back to their farmlands.

Table 1. Enrolment by region 1994, grades 1 to $4^{\prime}$

| Region | Grade 1 | Grade2 | Grade3 | Grade4 | Total |
| :--- | ---: | ---: | ---: | ---: | ---: |

## Gross and net enrolment rates

Both the gross enrolment rate (GER) and the net enrolment rate (NER) have experienced a decline of a few percentage points between 1992 and 1995. This decrease has been more evident in the past few years than between 1992 and 1994. The NER, which stood at 52.5 per cent in 1992, has now dropped to under 50 per cent. There is a significant difference of about 20 percentage points between gross and net enrolment ratios, which implies that

Table 1. Gross enrolment rate by sex

|  | Girls | Boys | Total |
| :---: | :---: | :---: | :---: |
| 1992 | 73.0 | 70.0 | 71.9 |
| 1993 | 73.2 | 71.0 | 72.1 |
| 1994 | 71.8 | 70.1 | 70.9 |
| 1995 | 69.1 | 67.7 | 68.4 |

Table 2. Net enrolment rate by sex

|  | Girls | Boys | Total |
| :--- | :--- | :--- | :--- |
| 1992 | 52.8 | 52.3 | 52.5 |
| 1993 | 52.1 | 51.2 | 51.7 |
| 1994 | 51.1 | 49.8 | 50.4 |
| 1995 | 49.4 | 48.3 | 48.8 |

a sizeable number of under-and especially overage children are in the primary education system. The differences between boys and girls are fairly minor: the GER for boys is somewhat higher than for girls, who on the other hand have a higher NER. This implies that the problem of over-age enrolment is more of a male than a female problem. There has been little change in gender disparity during the period under review.

Figure 1. Gross enrolment rate by sex

Figure 2. Net enrolment rate by sex

## Tanzania Mainland

## Gross enrolment rates

The gross enrolment rate (GER) at primary level, after remaining steady between 1992 and 1993, experienced a considerable decrease between 1993 and 1995: from 72 to 68 per cent. During this whole
period, the gross enrolment rate for girls was about 2 percentage points lower than that of boys. Boys GER, however, has decreased slightly more than girls, thus narrowing the gender gap.

Table 3. Net enrolment rate by sex

|  | Girls | Boys | Total |
| :--- | :---: | :---: | :---: |
| 1992 | 70.7 | 72.9 | 71.8 |
| 1993 | 70.9 | 73.0 | 71.9 |
| 1994 | 69.9 | 71.5 | 70.7 |
| 1995 | 67.4 | 68.8 | 68.1 |

Figure 3. Net enrolment rate by sex

## Net enrolment rates

The net enrolment rate (NER) experienced a similar evolution to that of the gross enrolment rate between 1992 and 1995. It decreased by about 4 percentage points and stands now at less than 50 per cent. For both boys and girls, the drop has been similar. The rate for girls decreased from 52.6 per cent in 1992 to 49.2 per cent in 1995. The rate for boys decreased from 52.1 per cent in 1992 to 48.0 per cent in 1995. The explanation for this could
lie, in part, in the establishment of private education institutions, following the liberalization of education and training in 1994. The enrolment of these institutes has not been taken fully into account in these figures. It is noteworthy that, unlike GER, NER for girls is higher than for boys. This implies that less under- and over-age girls than boys are enrolled.

Table 4. Net enrolment rates by sex

|  | Girls | Boys | Total |
| :--- | :--- | :--- | :--- |
| 1992 | 52.6 | 52.1 | 52.4 |
| 1993 | 52.0 | 50.9 | 51.5 |

| 1995 | 49.2 | 48.0 | 48.6 |

Figure 4. Net enrolment rates by sex

## Tanzania-Zanzibar

## Gross enrolment rates

The gross enrolment rate for primary education witnessed a steady upward trend, between 1985 and 1995, rising from about 55 per cent to 80 per cent. There was a sharp increase in GER in 1992, due to a change in the official school entry age from six to
seven years. The trends for male and female follow the same pattern. Throughout this decade, GER for males has been slightly above females. In the past year, the gap between the sexes has become smaller and is now about 2 percentage points.

Table 5. Gross enrolment rate by sex

|  | Male | Female | Total |
| :---: | :---: | :---: | :---: |

* change of entry age from 6 to 7 years

Figure 5. Gross enrolment rate by sex

## Net enrolment rates

The net enrolment rate (NER) at primary level has exhibited a less steady trend than the gross enrolment rate. There has been a noteworthy increase in NER between 1988 and 1994, the period under review, but this is due only to the sharp rise in 1992. This rise is to be attributed to the change in official school entry age from six to seven years. Neither before 1992 nor after, can an increasing trend be discerned. The NER stands now at just under 60 per cent. The NER of males has remained higher than that of females by about 2 per cent during the period, except in 1994, where NER of males decreased and that of females rose slightly,

Table 6. Net enrolment rate by sex

|  | Male | Female | Total |

Table 7. Net enrolment rate by district

|  | Male | Female | Total |
| :--- | :---: | :---: | :---: |
| Town | 52.8 | 57.0 | 55.0 |
| West | 111.6 | 122.6 | 117.1 |
| North 'A' | 65.3 | 53.9 | 59.5 |
| North 'B' | 50.8 | 49.9 | 50.4 |
| Central | 66.5 | 71.4 | 68.8 |
| South | 65.4 | 63.5 | 64.4 |
| Micheweni | 45.1 | 37.5 | 41.3 |
| Wete | 49.1 | 49.2 | 49.2 |
| Chake | 54.2 | 51.3 | 52.7 |
| Mkoani | 60.2 | 54.7 | 57.5 |

thus reducing the difference. The net enrolment rate varies substantially from district to district, with the highest rate in the West and the lowest in Micheweni. This could be explained by the existence of high adult illiteracy rates in the districts with low rates. In addition, districts like Micheweni are mainly fishing areas, with many children engaged in fishing. The West district has a net enrolment rate above 100 per cent because it enrols children coming from Town district, which has insufficient facilities and resources to provide for its population of school-age children.

## Gross enrolment rates'

The gross enrolment rate (GER) increased between 1990 and 1995, but in a very irregular way, as can be seen in Figure 1. The fluctuations which occurred could be related to the effects of structural adjustment programmes being implemented. It is also possible that the school census in some years was not complete, in view of the insecurity in some
border regions. There are large differences in GER between boys and girls, which have changed little over the past few years. Both males and females reached their highest GER of 86.9 per cent and 72.0 per cent respectively in 1995, and their lowest GER of 77.2 per cent and 61.0 per cent respectively in 1992.

Table 1. Gross enrolment rate by sex, 1990-1995

| Year | Boys | Girls | Total |
| :---: | :---: | :---: | :---: |
| 1990 | 77.9 | 62.6 | 70.3 |
| 1991 | 83.9 | 68.3 | 76.1 |
| 1992 | 77.2 | 61 | 69.1 |
| 1993 | 84.2 | 68.4 | 76.3 |
| 1994 | 78.8 | 65.8 | 72.3 |
| 1995 | 86.9 | 72 | 79.5 |

## Internal efficiency

The proportion of pupils who complete the primary cycle of those who were enrolled in P. 1 seven years earlier, has shown a disquieting decrease over the past few years. Over the last seven cycles, the completion rate has dropped from what was already a low 41.4 per cent (in 1989) to 31.5 per cent (in 1995). However, as some repeaters and drop-ins might have gone unreported, the actual rates could be still lower than this. Of those who reach Grade 7, about two thirds pass the end-of-primary-school examination. However, the pass rate was much higher in the 1980s (with the exception of 1988) when more than threequarters of the P. 7 candidates passed PLE. Over the past four years, the pass rate went down from 81 to 66 per cent. Among the possible causes could
be lack of adequate instructional materials and poor remuneration of teachers. With the implementation of the Primary Education Reform programme, this trend is likely to change in the near future. Not all pupils who pass the end-of-primary-school examination can continue to secondary education. The transition rate from primary to secondary has indeed been under 50 per cent for most of the period under review. This rate has slightly increased from 1984 to date. But the evolution has not been a regular one: there was a growth in the rate by about 20 percentage points in the first five years from 1984 to 1988 , a decrease of about 10 percentage points from 1988 to 1993, whence it increased by 5.5 percentage points from 1993 to 1994.

Table 2. Internal efficiency: completion, pass and transition rates

| YEAR | Completion rate | Pass rate | Transition rate |
| :---: | :---: | :---: | :---: |
| 1983 |  | 77.0 |  |
| 1984 |  | 77.7 | 31.6 |
| 1985 |  | 80.6 | 33.1 |
| 1986 |  | 81.2 | 43.4 |
| 1987 |  | 82.8 | 45.6 |

## Repeaters, drop-outs and orphans at the primary level

The percentage of repeaters for the whole of Uganda stood in 1995 at 17. About 10 per cent of pupils drop out of primary school. Regional disparities do exist, particularly with respect to the phenomenon of repetition. A distinction can thus be made between, on the one hand, the central region, and, on the other hand, the northern, western and eastern regions. The central region has lower percentages of repeaters and drop-outs than the rest of the country, where almost one out of
five pupils are repeaters. The central region however is disadvantaged in relation to another indicator: the percentage of orphans in primary schools. While for the country as a whole, a distressing 13 per cent of all pupils are orphans, this increases to 16 per cent in the central region. The specific problems and needs of such a large group of orphaned children must be seriously considered.

Table 3. Repeaters, drop-outs and orphans by region

| Regions | Repeaters | Drop-outs | Orphans |

## Access to education opportunities

Between 1985 and 1994, the annual increase of new entrants to Grade 1 was less than that of the school admission-age population, resulting in a decrease in the apparent intake rate from 107 per cent in 1985 to 83 per cent in 1994. Over the past decade, there has been a decline of about 29 per cent in the intake capacity at first level. The implications of this are that there is a backlog of eligible children who are not enrolled in the system, and the policy objective of increasing access capacity has yet to be achieved. Access to first grade is limited especially in the urban areas, but disparities do not exist between males and females. The net intake rates were approximately less than half of the apparent intake rate.This significant difference could essentially be explained by the
amount of new entrants outside the official age. In 1994,only 42 per cent of the total new entrants in Grade 1 were in the official admission-age category, 5 per cent were under age and 53 per cent over age. The figures also show that somewhat more boys started school at an older age compared to girls.
Regional differentials in capacity to take on new entrants at grade 1 do exist. Urbanized regions such as Lusaka (capital city) and Copperbelt (mining town) have lower apparent intake rates compared to other regions. These lower rates in the most urbanized regions signify the high demand for education and the limited capacity of the system to satisfy this demand.

Table 1. Evolution of apparent intake rate, 1985-1994

|  |  | Rates |  |  |

## Primary school participation rates by sex and region

In Zambia, despite the fact that the national education policy strives for universal primary education for all eligible children aged 7-13 years, there has been little progress towards this goal, as can be evidenced by the continued decline in participation over the past decade. Whereas the gross enrolment figures present a slightly more impressive scenario, they do conceal a large proportion of pupils enrolled outside (mostly older) the official age group of 7-13 years. In 1994, for instance, about 15 per cent of the pupils enrolled in primary were outside the official age group of 7-13 years.
If the target of enrolling all the eligible children by the year 2000 is to be achieved, the participation rate must increase by 3 points per annum. Government efforts therefore will have to increase substantially. The gender differentials in participation are paramount. In virtually all the
years under observation, there is a gender gap of about 10 per cent confirming the existence of discrimination within the education system.
Regional imbalances do exist. The urbanized regions of Copperbelt, Lusaka, Central and Southern (situated along the rail line) tend to have greater participation compared to the less urbanized regions of Luapula, Northern, Eastern, Northern/ Western and Western (regions not located along the rail line) respectively. It can further be observed that gender disparities are higher in the less urbanized regions than in the urbanized ones. In addition to weaknesses in the education delivery system, there are other factors that militate against fair participation of girls, such as pregnancy, early marriage and other socio-cultural factors. This is the most significant reason why rural regions, where traditional values and norms are stronger, register lower female participation rates.

## Pupils per teacher and per class

In Zambia, 40 pupils per teacher is considered to be an acceptable ratio for effective learning to take place. The 1995 ratio of 39 implies that, as a country, effective learning could be assumed to be taking place, provided that all other factors remain constant. However, there are marked differences between various regions. Urbanized regions tend to have more trained teachers than less urbanized ones. Lack of incentives and the absence of social infrastructure inter alia are believed to be among the reasons for this discrepancy. As a result, rural areas are under-

Table 6. Pupil/teacher ratio by region, 1995

| Zambia | $\mathbf{3 9}$ |

staffed and hence the observed relatively high pupil/ teacher ratios in the less urbanized regions. The problem as a whole is, however, circumvented by the employment of non-qualified teachers, especially in the rural areas. The recommended average class size is 40 pupils per class. The situation however reflects adherence to this norm in the urbanized regions and a lower ratio in the less-urbanized regions.A higher teacher-per-class ratio in less urbanized regions can explain the difference between pupil/class and pupil/teacher ratios.

## Internal efficiency of the system

There is a system in place of automatic promotion at all grades of primary education. There is no examination to determine progress to the next grade level. Past research has revealed a number of factors that are associated with the high dropouts with financial constraints, early marriages, pregnancy etc. cited as the prime factors. Due to limitations in access to upper primary schools,
a considerable number of pupils drop out at grade 4 , especially in the less urbanized regions. The grade 7 drop-outs are the most significant. Lack of secondary school places is one explanation for this.Though repetition is not legally acceptable, there is evidence of a considerable number of such cases. Generally more boys than girls repeat.

# A FEW INDICATORS ON PRIMARY EDUCATION 

## ZIMBABWE

Document prepared by :

Mr Glory Joseph Tlou MAKWATI and
Mr Evans Sibangani CHITANDO
Policy Planning Division

Ministry of Education

The period after independence witnessed a massive expansion in the education sector in response to the government's policy objective of ensuring access to schools by all children. The latter could only be achieved through the improvement of physical infrastructure and the establishment of more primary schools. The period 1980-95 experienced a growth rate of 46.57 per cent, as the number of primary schools increased from 3,161 in 1980 to 4,633 in 1995. However, since 1986 the policy has shifted from a quantitative expansion to the consolidation of quality education, hence the stabilization in the establishment of
schools. Indeed, while between 1980 and 1985 the number of schools increased by 34 per cent, the increase in the second half of the previous decade was less than 7 per cent and only about 2 per cent between 1990 and 1995 (see Table 2). The expansion in the number of schools is accompanied by a similar expansion in enrolment. The number of pupils enrolled almost doubled between 1980 and 1985. The growth has levelled off since then. Girls who were slighly underrepresented in 1980, have now achieved near equal representation with boys.

## Net enrolment rate

In Zimbabwe the official entry age is six years. Only 37.7 per cent of the six year-olds are actually enrolled. This net enrolment rate (NER) for the six year-olds can be assumed to be the Net Intake Rate (NIR) for the country. The delayed entry of children at the official age may be attributed to long distances between school and home, especially for the rural-based communities, and the reintroduction of school fees in the urban areas.

These factors may in some cases cause parents to hold back sending their children to school until they are mature. For ages 8-12 years, the enrolment rate actually increases to above 90 per cent. The NER for 6 to 12 year-olds stands at 81.9 per cent, with parity between the sexes at this stage. In order to achieve Basic Education for All by the year 2000, Zimbabwe needs an annual growth of its net enrolment rate of 3.6 percentage points.

Figure 3. Net enrolment rate by gender and age

Table 4. Net enrolment rate by gender and age

|  | National | Girls | Boys |
| :--- | :---: | :---: | :---: |
| 6 years | 32.7 | 35.4 | 30.0 |
| 7 years | 76.3 | 77.1 | 75.6 |
| 8 years | 91.6 | 90.8 | 92.4 |
| 9 years | 92.6 | 93.0 | 92.1 |
| 10 years | 96.6 | 95.0 | 98.2 |
| 11 years | 94.9 | 94.1 | 95.6 |
| 12 years | 93.2 | 92.7 | 93.8 |
| Overall | $\mathbf{8 1 . 9}$ | $\mathbf{8 1 . 9}$ | $\mathbf{8 1 . 8}$ |

## Net enrolment rate by region

The regional comparative figure and table (Figure 4, Table 5), below, depict a scenario characterized by striking disparities. Midlands, Mat.South, Mat.North and Manicaland regions have an NER close to the national average of 81.9 per cent. Harare region is below the national average, although it is an urban area. The low NER may be caused by the re-introduction of tuition fees and retrenchments of teachers in urban areas. Mash West has reported a NER of just above 100 per cent for boys. This situation may be the result of over-reporting by the region, coupled with unreported repeaters and drop-ins, but equally by immigration from other regions. Mash Central is a rural region with difficult terrain and large commercial farming areas. This may account for the lower NER. Mash East has the lowest NER,
which may in part be attributed to under-reporting, submission of incorrect information or incomplete data. While at the national level, there exists almost complete equality in net enrolment between boys and girls, this is not the case for many regions. In some, in particular Masvingo and Mat. South and, to a lesser extent, Mat. North and the Midlands, girls record a higher NER. In Manicaland, Harare and particularly Mash. West, the opposite situation prevails. These differences between regions require further investigation and research. In order to achieve Basic Education For All (EFA) by the year 2000, regions such as Harare, Mash.Central and Mash.East will have to make particularly strong efforts: they have to increase their NER by 5.6 per cent, 4.8 per cent and 7.6 per cent points respectively.

Table 5. Net enrolment rate by region and gender

|  | Region | Girls | Boys |
| :--- | :---: | :---: | :---: |
| Harare | 72.0 | 71.2 | 72.9 |
| Manicaland | 83.9 | 82.8 | 85.0 |
| Mash.Central | 75.8 | 75.4 | 76.2 |

Figure 4. Net enrolment rate by region

## Pupil/teacher Ratio

The average pupil/teacher ratio in Zimbabwe is 40:1 at primary-school level. Over the past few years, the actual national average has hovered around this limit, but did not exceed it, except in 1993 when the ratio rose to a peak of $42: 1$. The number of teachers indeed decreased by 5,000 between 1992 and 1993. The current ratio of $39: 1$ seems to indicate a balance between the increase in enrolments and in teacher recruitment within the system. This can be attributed to the government's policy of consolidating earlier gains/achievements
with a view to providing quality education by the year 2000. Differences in pupil/teacher ratios between the regions were more marked in 1995 than in 1996. In 1995 two regions, Manicaland and Mashonaland West, recorded ratios above the national average, respectively $44: 1$ and $41: 1$, while three regions had a ratio of only $37: 1$. In 1996, the national pupil/teacher ratio remained at the same level as in 1995, but regional differences decreased significantly, with all regions having a ratio between 38:1 and 40:1.

Table 6. Evolution of pupil/teacher ratio

|  |  |  | Pupils/Teacher <br> Ratio |
| :---: | :---: | :---: | :---: |
| 1990 | $2,119,865$ | 60,886 | 35 |
| 1991 | $2,294,934$ | 58,436 | 39 |
| 1992 | $2,305,765$ | 60,814 | 38 |
| 1993 | $2,436,671$ | 61,506 | 40 |

## Trained and untrained teachers

The period immediately after independence witnessed a great increase in the number of untrained teachers due to the massive expansion of the system and the resulting recruitment of many untrained teachers. The proportion of untrained teachers increased from about a quarter in 1980, to over half in 1983 and to 60 per cent in 1985. Since then, their percentage has steadily declined, except in 1987, the year which witnessed the removal of ghost teachers from the system following the incorporation of the majority of teachers into the Public Service from the Unified Teaching Service. In 1995, only a quarter of primary teachers remained untrained. The government $s$ objective of providing a quality

Table 8. Share of trained teachers

|  | Trained | Untrained |
| :---: | :---: | :---: |
| 1980 | 71.8 | 28.2 |
| 1981 | 60.0 | 40.0 |
| 1982 | 52.1 | 47.9 |
| 1983 | 49.4 | 50.6 |
| 1984 | 40.7 | 59.3 |
| 1985 | 39.8 | 60.2 |
| 1986 | 50.2 | 49.8 |
| 1987 | 45.7 | 54.3 |
| 1988 | 51.0 | 49.0 |
| 1989 | 50.9 | 49.1 |
| 1990 | 51.5 | 48.5 |
| 1991 | 64.1 | 35.9 |
| 1992 | 67.1 | 32.9 |
| 1993 | 67.9 | 32.1 |
| 1994 | 71.1 | 28.9 |
| 1995 | 74.8 | 25.2 |

teaching service will require an annual increase of 5 percentage points in the number of trained teachers, to meet the target set for the year 2000. Regional differences do exist between the capital region Harare and all the other regions. In the Harare region almost all teachers, i.e. 96 per cent, are trained. The other regions all count between 20 and 35 per cent untrained teachers. Regions with a large rural setting/component, e.g. Mashonaland Central ( 65 per cent), have the lowest percentage of trained teachers. This can be attributed to the reluctance of trained personnel to serve in the rural areas. However, the current recruitment and deployment policy is aimed at redressing these regional disparities.

Table 9. Share of trained teachers by region

| Region | Trained | Untrained |
| :--- | :---: | :---: |
| Harare | 96.0 | 4.0 |
| Manicaland | 72.3 | 27.7 |
| Mash.Central | 65.0 | 35.0 |
| Mash.East | 72.6 | 27.4 |
| Mash.West | 72.8 | 27.2 |
| Masvingo | 80.7 | 19.3 |
| Mat.North | 70.2 | 29.8 |
| Mat.South | 76.4 | 23.6 |
| Midlands | 70.0 | 30.0 |
| ZIMBABWE | $\mathbf{7 4 . 8}$ | $\mathbf{2 5 . 2}$ |

[^0]:    With the New Education and Training Policy (NETP), the structure of primary education in Ethiopia has changed and consists of two cycles of four grades: 1-4 and 5-8. However, as the change in the curriculum is not yet completed, the former structure of primary education (Grades 1-6) is operational to date. Therefore the analysis that follows has to confine itself to the former structure of Grades 1-6. In order to calculate the enrolment ratio, data on the school-age population are a prerequisite. But as the data on the latter are not available, UN's estimates and projections are utilized. As the following indicators are calculated for training purposes only, they are not to be quoted or utilized for any official purpose.

[^1]:    1 The source for all data is UNESCO-Somalia.

[^2]:    1 School enrolment figures are taken from the attendance register of pupils enrolled in full-time education and include children registered at school, but who may not be attending class daily.
